Sequence 2, Application US/09227421
Patent No. 6559357
Patent No. 6559357
GENERAL INFORMATION:
APPLICANT: Fischer, Robert L.
APPLICANT: Mizukami, Yukiko
APPLICANT: The Regents of the University of California
TITLE OF INVENTION: Methods for Altering Organ Mass, Controlling Ferl
TITLE OF INVENTION: and Enhancing Asexual Reproduction in Plants
TITLE OF INVENTION UNMEER: US/09/227,421
CURRENT APPLICATION NUMBER: US/09/227,421
CURRENT FILING DATE: 1999-01-08
PRIOR APPLICATION UNUMBER: US 09/227,421
PRIOR FILING DATE: 1999-01-08
PRIOR FILING DATE: 1999-01-08
SOFTWARE: PatentIn Ver. 2.1
SEQ ID NO 2
LENGTH; 555
TYPE: PRT
CRGANISM: Arabidopsis thaliana

Sequence 2, Application US/09479855

Patent No. 6639128

GENERAL INFORMATION:

APPLICANT: Fischer, Robert L.

APPLICANT: Mizukami, Yukiko

APPLICANT: The Regents of the University of California

TITLE OF INVENTION: Methods for Altering Organ Mass, Controlling Fertility

TITLE OF INVENTION: and Enhancing Asexual Reproduction in Plants

FILE REFERENCE: 023070-090720US

CURRENT APPLICATION NUMBER: US/09/479,855

CURRENT FILING DATE: 2000-01-07

NUMBER OF SEQ ID NOS: 8

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 2

LENGTH: 555

TYPE: PRT
ORGANISM: Arabidopsis thaliana
ORGANISM: Arabidopsis thaliana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        日

Sequence 5, Application US/09227421

| Patent No. 655957
| Patent No. 655957
| GENERAL INFORMATION:
| APPLICANT: Fischer, Robert L.
| APPLICANT: Mizukami, Yukiko
| APPLICANT: The Regents of the University of California
| TITLE OF INVENTION: Methods for Altering Organ Mass, Controll:
| TITLE OF INVENTION: and Enhancing Asexual Reproduction in Planting Fill Reference: 023070-090700FC
| FILE REFERENCE: 023070-090700FC
| CURRENT APPLICATION NUMBER: US/09/227,421
| PRIOR APPLICATION NUMBER: US/09/227,421
| PRIOR APPLICATION NUMBER: US/09/227,421
| PRIOR PILING DATE: 1999-01-08
| PRIOR FILING DATE: 1999-01-08
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8

Sequence 5, Application US/09479855
; Patent No. 6639128
; GENERAL INFORMATION:
APPLICANT: Fischer, Robert L.
APPLICANT: Mischer, Robert L.
APPLICANT: Mischer, Robert L.
APPLICANT: Mischer, Tukiko
APPLICANT: The Regents of the University of California
TITLE OF INVENTION: Methods for Altering Organ Mass, Controlling Fertility
TITLE OF INVENTION: and Enhancing Asexual Reproduction in Plants
FILE REFERENCE: 023070-090720US
CURRENT APPLICATION NUMBER: US/09/479,855
CURRENT APPLICATION NUMBER: US/09/479,855
CURRENT FILING DATE: 2000-01-07
NUMBER OF SEQ ID NOS: 8
SOFTWARE: Patentin Ver. 2.1
; SEQ ID NO 5
LENGTH: 548
TYPE: PRT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 4, Application US/09479855

| Patent No. 6639128
| GENERAL INPORMATION:
| APPLICANT: Fischer, Robert L.
| APPLICANT: Mizukami, Yukiko
| APPLICANT: The Regents of the University of California
| APPLICANT: The Regents of the University of California
| TITLE OF INVENTION: Methods for Altering Organ Mass, Contro
| TITLE OF INVENTION: and Enhancing Asexual Reproduction in
| FILE REFERENCE: 023070-090720US
| CURRENT APPLICATION NUMBER: US/09/479,855
| CURRENT FILING DATE: 2000-01-07
| NUMBER OF SEQ ID NOS: 8
| SOFTWARE: Patentin Ver: 2.1
| SEO ID NO 4
| LENGTH: 1738
| TYPE: DNA
| ORGANISM: Brassica napus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Percent Similarity:

Example 1; Page 127-130; 169pp; English.

The present sequence is that of cDNA encoding GmANT1, a newly identified CC AINTEGUMENTA-like (ANT-like) polypeptide of soybean. The cDNA comprises CC the insert of clone CPR67663, which was obtained from a soybean sequence Cd database screening using Arabidopsis ANT as query. Also isolated was CC clone CPR67666 (see ABN94481) encoding GmANT2 (see ABN9637). GmANT1 and CC GmANT2 show homology to ANT in 2 N-terminal Ap2 DNA binding domains, but CC chave ction provides nucleic acids encoding ANT-like polypeptides CC comprising, in the N-terminal to C-terminal direction, 2 Ap2 DNA binding CC comprising, in the N-terminal to C-terminal direction, 2 Ap2 DNA binding CC comprising, in the N-terminal to C-terminal direction, 2 Ap2 DNA binding CC conding the ANT-like polypeptides across selected from those given in ABB79629-35. ANT-like polypeptides have been identified in soybean, CC rice, cotton and corn (see ABB79638-41). Nucleic acids (see ABN94480-86) CC encoding the ANT-like polypeptides can be used in the construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, cc tother quality traits, such as increased size of plant organs. These CC plants are especially useful for production of ethanol or animal CC encoding the such as increased size of plant organs. These CC encoding the such as increased size of plant organs. These condulate expression of endogenous ANT-like gene expression, in sense co-suppression to modulate expression of endogenous ANT-like gene spression, in sense co-suppression to material plant production of the plant organs are technology to condulate expression of endogenous spread and plant due to a mutation in one or more endogenous genes encoding the ANT-like polypeptides

XX more endogenous genes encoding the ANT-like polypeptides

The present sequence is that of cDNA encoding GmANT2, a newly identified AINTEGUMENTA-like (ANT-like) polypeptide of soybean. The cDNA comprises CC the insert of clone CPR67626, which was obtained from a soybean sequence Cd database screening using Arabidopsis ANT as query. Also isolated was CC clone CPR67663 (see ABN94480) encoding GmANT1 (see ABN97636). GmANT1 and CC GmANT2 show homology to ANT in 2 N-terminal AP2 DNA binding domains, but have C-terminal sequences that bear little, if any, homology to ANT. The CC invention provides nucleic acids encoding ANT-like polypeptides (comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from those given comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from those given comprising conton and corn (see ABB79636-41). Nucleic acids (see ABN9480-86) (comprise followed by an amino acid subsequence selected from those given conton and corn (see ABB79636-41). Nucleic acids (see ABN9480-86) (comprise followed by an amino acid subsequence selected from those given conton plants, especially corn, soybean, cannola, wheat, cotton, comprise for plants, especially corn, soybean, cannola, wheat, cotton, corn for the construction of the construction of plants are especially useful for production of plant organs. These corporates endogenous ANT-like gene expression, in sense co-suppression to modulate expression of endogenous ANT-like gene sapression, in sense co-suppression to markers for traits linked to those genes that they are part of, as genetically and physically mapping the genes that they are part of, as compression of endogenous ANT-like genes, or in the identification of compression of endogenous and the plant of a mutation in one or more endogenous genes encoding the ANT-like polypeptides

Sequence 2323 BP; 746 A; 482 C; 492 G; 603 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CDNAB, suggesting tissue-specific expression. Initial OsaNTI clones had CC been identified in a rice database screening using the newly identified Sybpen ANT-like polypeptide GmaNTI as query. An additional rice clone (see ABN84483) encoding OsaNT2 (see ABB79639) was also isolated OsaNT1 CD polypeptide shares high homology with Arabidopsis ANT, GmaNT1 and GmANT2 CC at the N-terminal AP2 DNA binding domains, shares conserved segments at CC not with ANT, at the C-terminus. The invention provides nucleic acids encoding ANT-like polypeptides comprising, in the N-terminal to C-C terminal direction, 2 AP2 DNA binding domains followed by an amino acid consumption and corn (see CC polypeptides were identified in soybean, rice, cotton and corn (see CC polypeptides were identified in soybean, rice, cotton and corn (see CC polypeptides can be used in the construction of transgenic plants, CC especially corn, soybean, canola, wheat, cotton, tomato or potato (all craimed) having improved agronomic, horticultural or other quality craits, such as increased size of plant organs. These plants are CC enabled having also be used in antisense technology to suppress CC endogenous ANT-like gene expression, in sense co-suppression to modulate expression of endogenous ANT-like genes, as probes for genetically and physically mapping the genes that they are part of, as markers for traits of linked to those genes, or in the identification of loss of function cutant phenotypes of a plant due to a mutation in one or more endogenous construction in one or more endogenous construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the coding region for OSANT1, a newly identified AINTEGUMENTA-like (ANT-like) polypeptide of rice. The CDNA was obtained by PCR amplification using gene-specific primers (see ABN84496-97) using paniale cDNA as template. The cDNA was not amplified from root or leaf cDNAs, suggesting tissue-specific expression. Initial OSANT1 clones had

The present sequence is the coding region of the rice OsANT2 gene cancoding a newly identified AINTEGUMENTA-like (ANT-like) polypeptide. The COSANT2 gene (see also AEN84483) was isolated following a rice database screening using soybean ANT-like polypeptide GRANT1 as query. Another rice clone (see AEN84482) encoding OsANT1 (see AEN79638) was also comprising, in the N-terminal to C-terminal aNT-like polypeptide success and the color of the polypeptide of the color of the rection, 2 AP2 polypeptides comprising, in the N-terminal to C-terminal direction, 2 AP2 polypeptides comprising, in the N-terminal to C-terminal direction, 2 AP2 polypeptides were identified in soybean, rice, cotton and corn (see AEB7963641). Nucleic acids (see CC AEN84480-86) encoding the ANT-like polypeptides were identified in the construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato (all claimed) having improved agronomic, cotton, tomato or potato (all claimed) having improved agronomic, cotton, tomato or potato (all claimed) having improved agronomic, corgans. These plants are especially useful for production of ethanol or cryans. These plants are especially useful for production of ethanol or suppression to modulate expression of endogenous ANT-like gene expression, in sense copupression to modulate expression of endogenous ANT-like genes, as probes for markers for traits linked to those genes, or in the color in one or more endogenous genes encoding the ANT-like to a color polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acids encoding AINTEGUMENTA-like polypeptides useful improving agronomic, horticultural, and quality traits of plants,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2002-599798/64.
